

Monitoring & Control System

The PSS Monitoring and Control system (MCS) presents information in a clear and understandable method for all levels of personnel, from engineering to the untrained or unfamiliar individual. Site specific electrical one lines, floor plans and related equipment are presented in a complete picture of the data center infrastructure allowing the operator to easily identify potential problems.

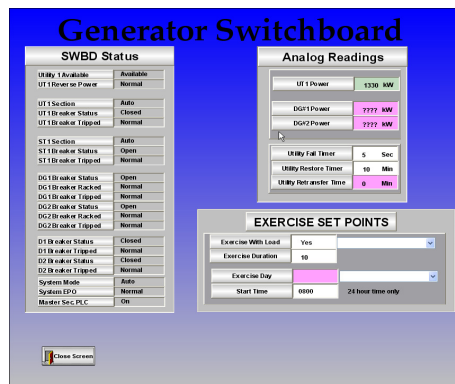

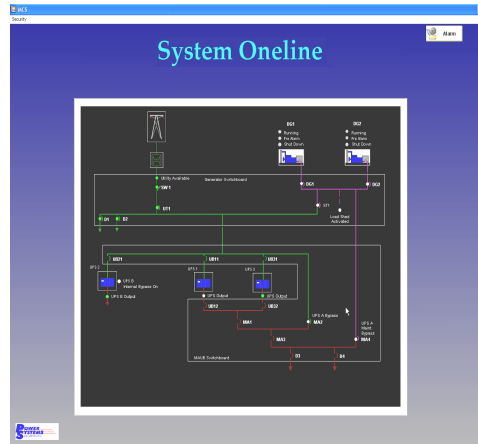

PSS will create and design custom screens, configure the system's presentation and operation to your satisfaction. Since there is no R&D expense involved with developing hardware or purchasing expensive software packages, PSS can custom design any system, large or small, at significant savings.

The PSS Monitoring & Control System features:

- Customized screen layouts including site specific floor plans, electrical one lines with actual equipment pictures and operational instructions.
- Remote communication and status via modem and PC Anywhere.
- Remote control of equipment.
- History log file in Excell database format.

- Standard “off the shelf” hardware.
- Low installation costs.
- Optional real time viewing from Web.

Facility managers can rely upon the operational simplicity, efficiency, reliability and effectiveness of the PSS Monitoring and Control systems.
